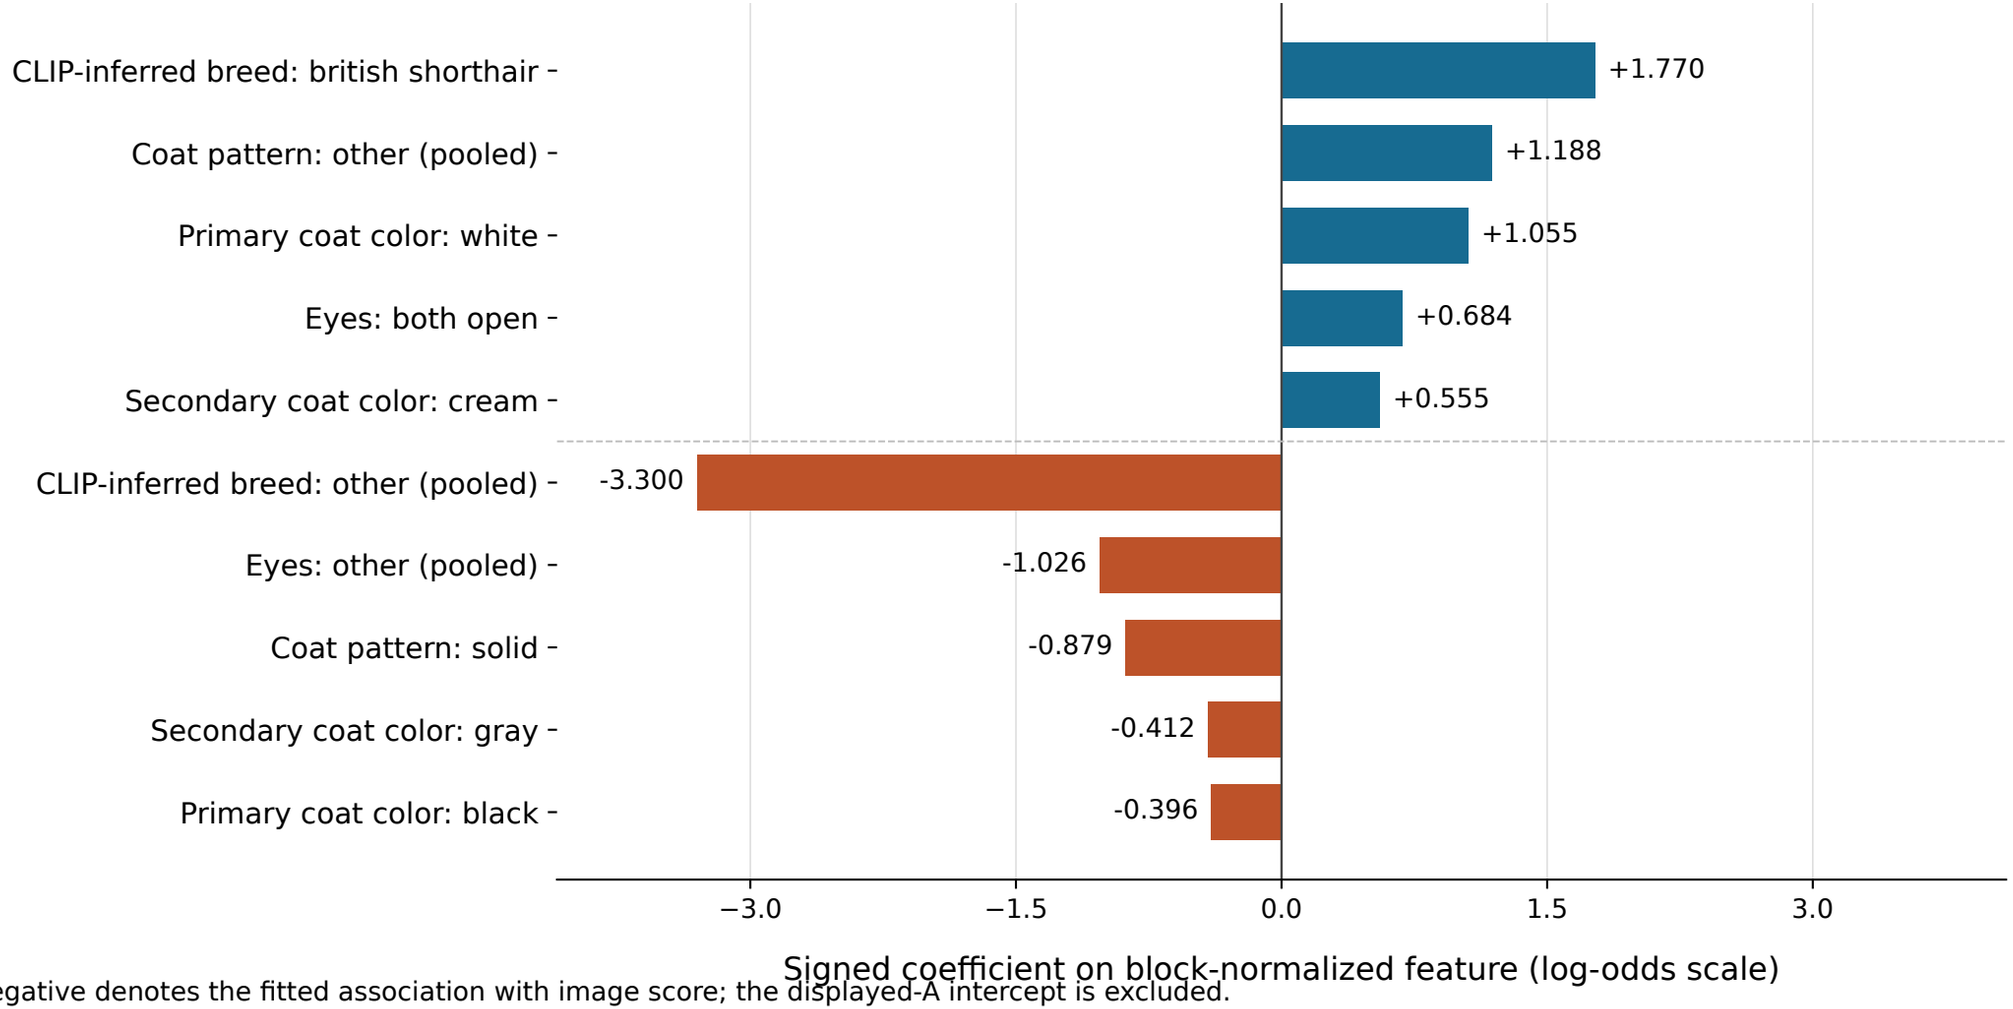
Automated image attributes (M3-Y)

Predictive Association, Not Causal Effect

Five largest positive and five largest negative fitted feature weights



Positive / negative denotes the fitted association with image score; the displayed-A intercept is excluded.

Category differences must be interpreted within the same attribute; indicator weights depend on model coding.

Numeric and categorical scales differ. 'Other' pools rare levels; CLIP-inferred breed is not true pedigree.

These are conditional model weights, not causal effects or standalone feature importance.
