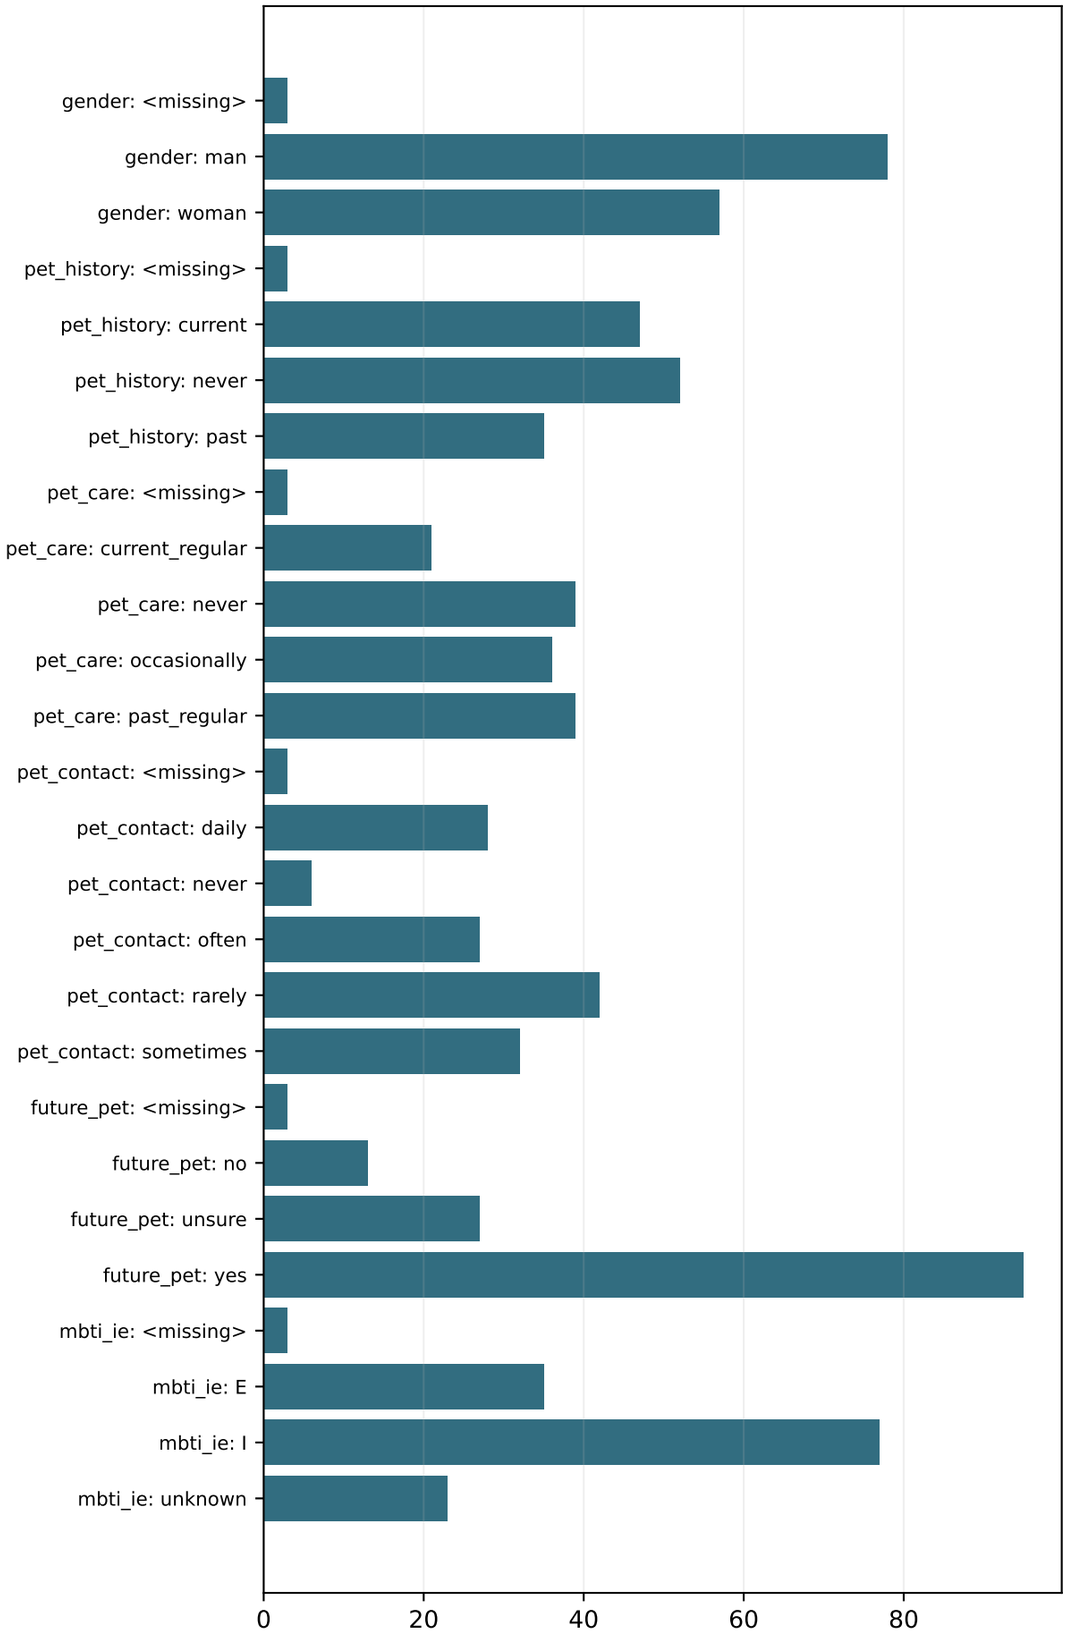
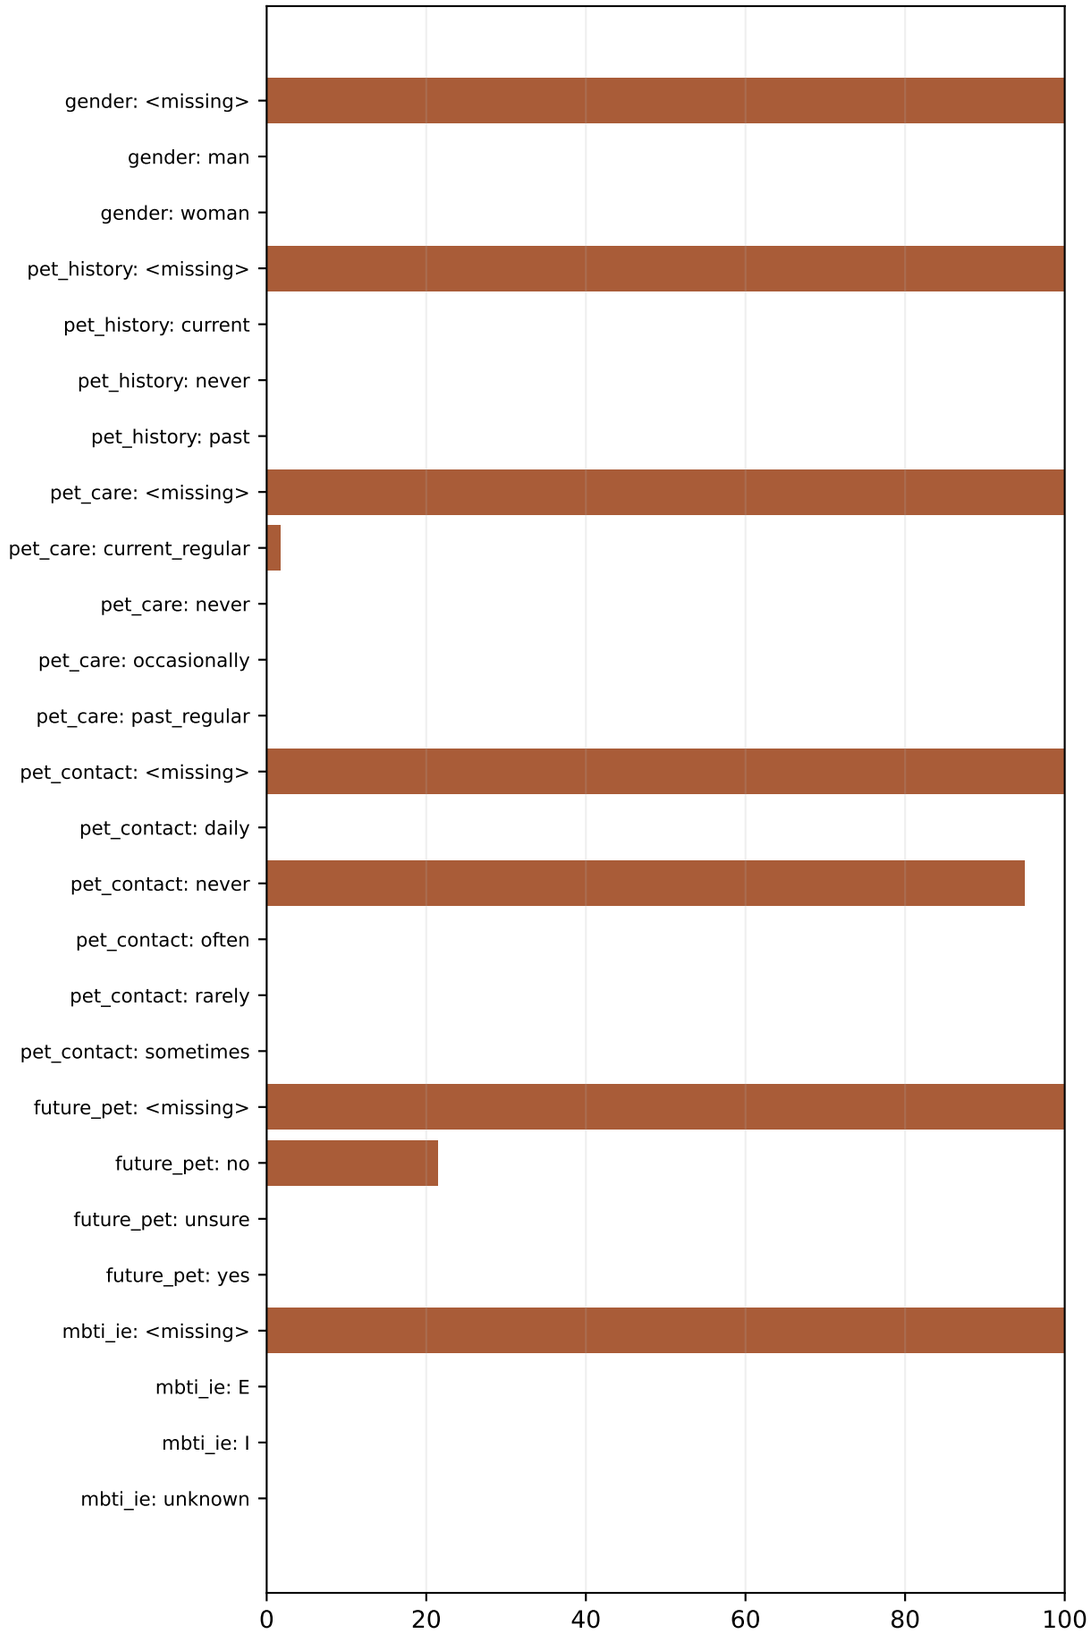
Per-cat demographic support: fit

Typical per-cat group support



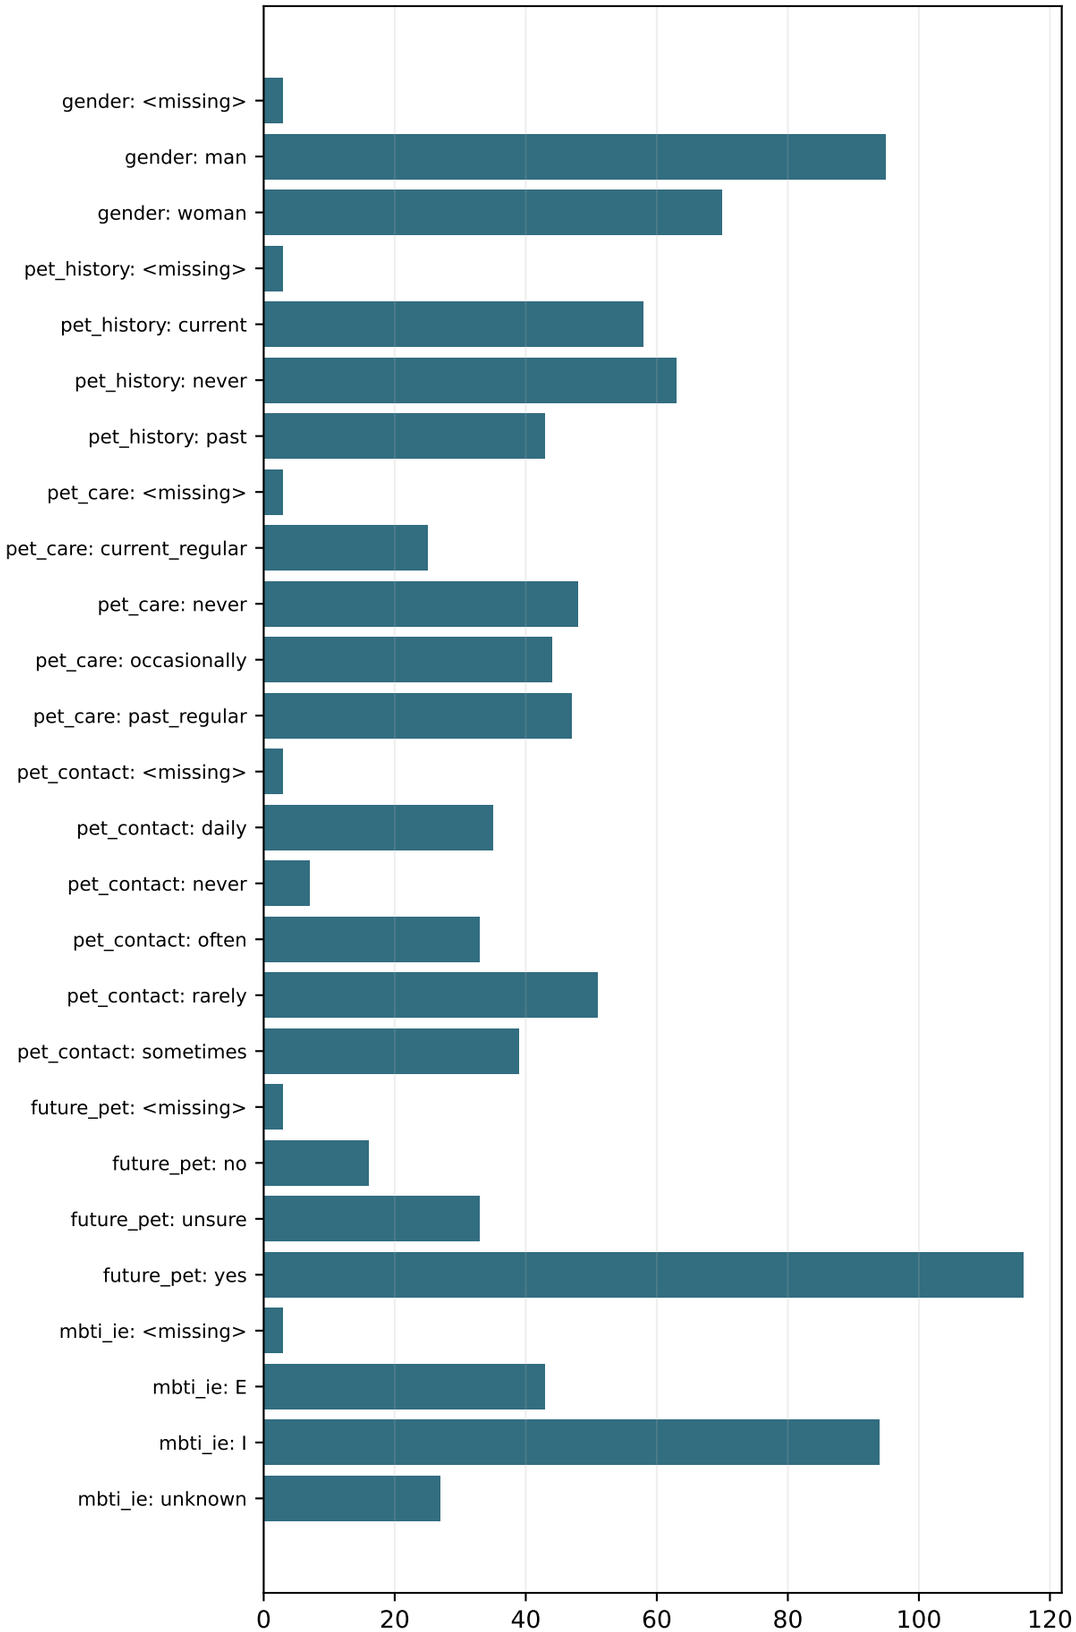
Sparse per-cat group cells



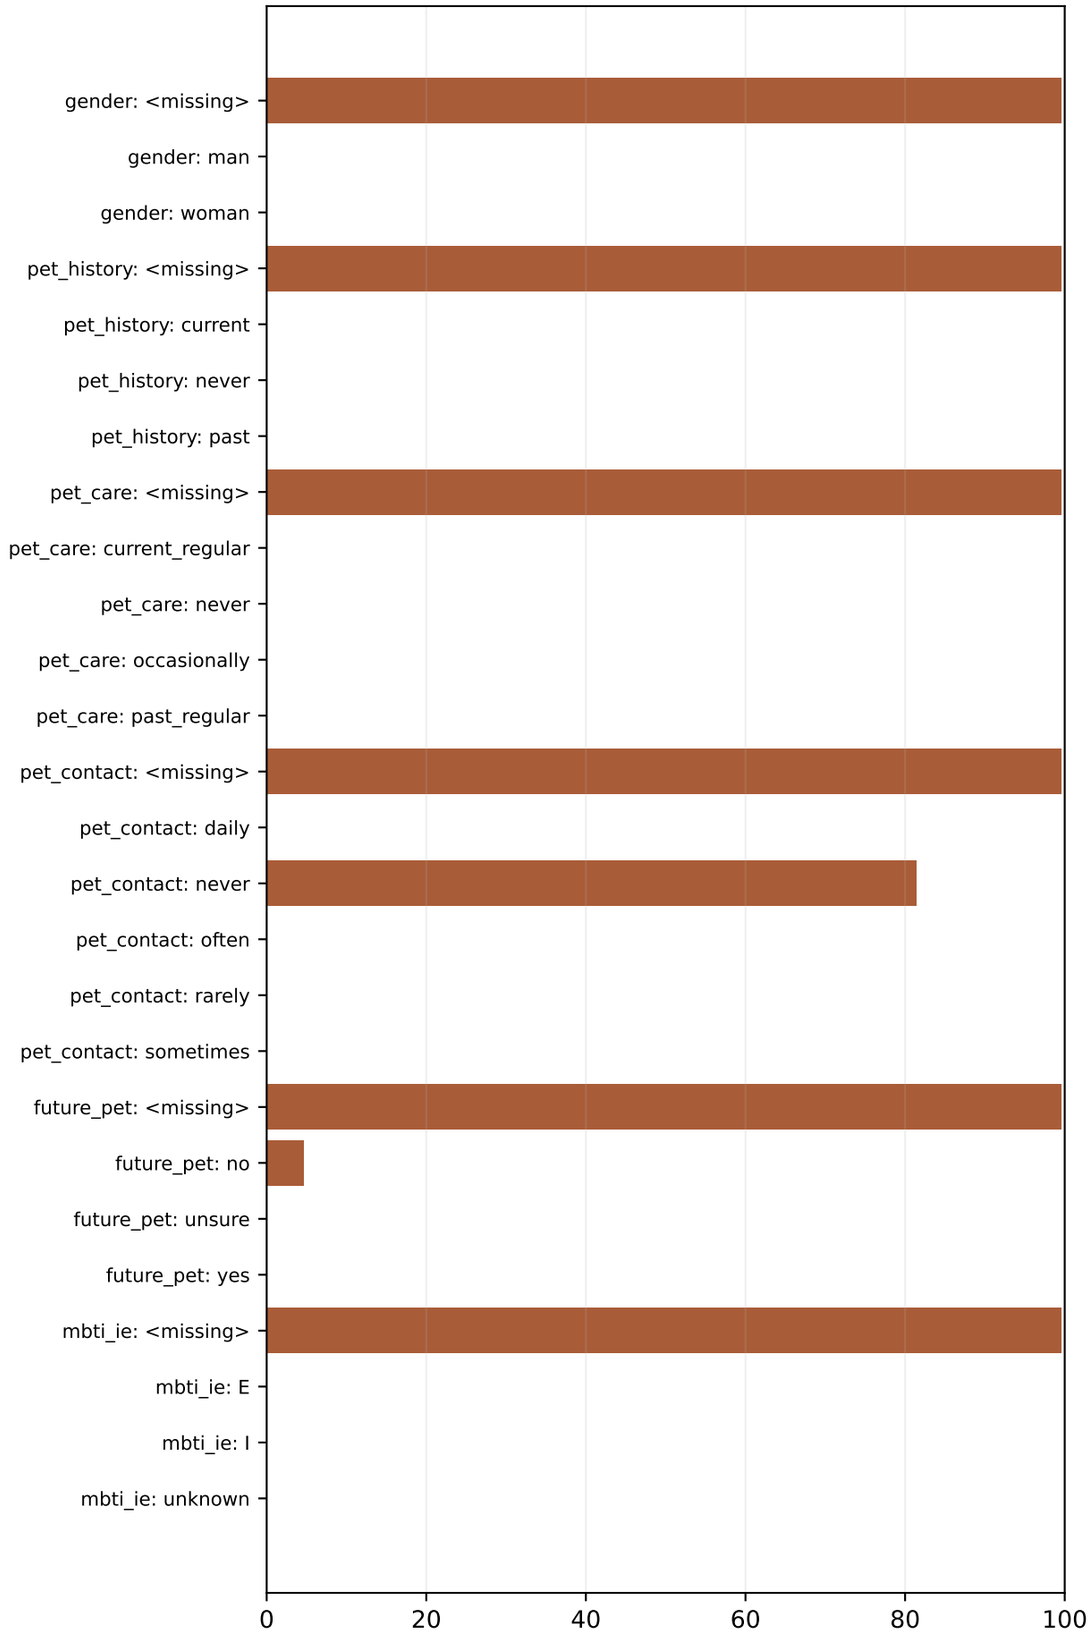
Each group uses the same fitting-cat universe; within-cat responses count once. 10 is illustrative, not a power threshold.

Per-cat demographic support: development

Typical per-cat group support



Sparse per-cat group cells



Each group uses the same fitting-cat universe; within-cat responses count once. 10 is illustrative, not a power threshold.

Interpretation: cat support is not matched-pair support

- Development gender: 237/237 cats appear in both man and woman groups.

- Development gender: 4713 photo pairs have at least one response from each group.

- Development gender: 0 shared pairs have at least five responses in each group.

- Per-cat counts measure response records, not distinct respondents or independent observations.

- Cat counts aggregate different photo pairs; they do not establish matched semantic-feature preference.

- Missing categories are tracked separately and are not substantive demographic groups.

- Structural fit/development rows only; no outcomes were read and no models were fitted.
